

CORDA Democratic AI-Readiness Index

2025 Edition

CORDA Democracy Fellows · Coleman Snell · Jason Hung · Casimir Wypyski · Eilaf Mohamed

Preface

Artificial Intelligence (AI)’s societal impact, ranging from shaping the information environment to the concentration of power associated with AI development, has the potential to affect the democratic level of different countries. Without sufficient guidelines, AI will contribute to democratic backsliding over advancing democracies.

We teamed up as CORDA research fellows under the mentorship of Coleman Snell to figure out a way of extending existing democratic health indices (e.g., V-Dem, Freedom House, EIU Democracy Index, RSF, IDEA, WJP) to capture AI threat environments. We believe these indices lack indicators capturing whether democracies are structurally equipped and prepared to govern AI before harms become irreversible. This is because, as currently constructed, these indices assume pre-AI democracy signals will remain the same after the adoption of AI. For us, traditional democracy signals become insufficient when AI introduces new mechanisms to amplify drivers of political change, including economic deprivation, information environment shocks, elite defection, state capacity erosion, and polarisation. We believe AI can influence them via job displacement, synthetic media generation, AI outpacing regulatory capacity, automated governance paralysis, and the production of AI elites. Moreover, current AI governance indices fail to capture these risks. In sum, having these concerns has led us to believe that measuring AI-related signals would give beneficiaries (including researchers, policy experts and industry professionals) useful insights for assessing global countries’ exposure and readiness for democratic AI risks. Overall, our objective is designing this AI-readiness index project, followed by building democratic AI amplified backsliding predictions. These predictions can give warning signals before harm becomes irreversible.

In our methodology, we attempted to follow the guidelines of the OECD composite indicators regarding data imputation, normalisation, weighting, aggregation, and sensitivity testing. That said, we are open to discussions about our theoretical framing and the methodological decisions we made in constructing the index. It’s important to note that a combination of both AI-specific indicators and general democratic health indicators was used to serve as a proxy for a country’s exposure and readiness for democratic AI risks. While these indicators were helpful in constructing a proof of concept, we think there is high value in producing original scores for the drivers. Our decision is driven by the limited signals for some of the democratic risks we are interested in.

We thank Jeba Sania for her feedback on our measurement uncertainties. We are also grateful to the CORDA team for setting the structural constraints that helped us channel our efforts and experiences to work on this project.

Key Findings

- The CORDA Index reveals a wide spread in democratic AI-readiness, from 86.2 (Denmark) to 28.6 (China), with the 10 highest-scoring countries—Denmark, Sweden, Germany, the Netherlands, Japan, Australia, Canada, the United Kingdom, New Zealand, and France—all classified as established liberal democracies. These findings suggest that mature democratic institutions provide a structural buffer against the amplification mechanisms our framework identifies, though this buffer *per se* is uneven across drivers, as the D5 results below illustrate.
- D5 (Polarisation and Affective Tribalism) is consistently the weakest-scoring driver across nearly all studied countries, including those at the top of the overall ranking. For example, Denmark's D5 score (70.5) is its lowest of the five drivers, and the same pattern holds for Sweden, Germany, and the Netherlands, indicating that affective polarisation is not confined to lower-ranked countries but is a near-universal vulnerability. Such findings align with D5's low internal consistency ($\alpha = 0.088$ cross-sectional) and its role as a cross-cutting amplifier.
- The gap between the top and bottom of the ranking is driven primarily by D1 (Economic Inequality) and D4 (State Capacity Erosion). For example, China (28.6 overall) scores 22.7 on D1 and 28.9 on D4, against Denmark's 89.7 and 84.1 respectively, a far larger relative gap than is observed for D2, D3, or D5, which suggests that economic structure and state capacity remain the most differentiating drivers of democratic AI-readiness at the extremes of the distribution.
- New Zealand's 10th-place ranking is the least robust in the index (note: under geometric but not linear aggregation). New Zealand falls from 10th to 19th (Kendall's $\tau = 0.7835$; the largest shift of any country) in our sensitivity analysis, owing to its comparatively low D5 score (53.7) against four other drivers ranging from 68 to 80. Here, Sweden shows a smaller version of the same pattern.
- Three countries in our sample, namely the United States, Israel, and Poland, are classified as Electoral rather than Liberal Democracies under V-Dem's 2024 Regimes of the World taxonomy. Such classifications reflect constraints on civil liberties and judicial independence but not any judgement by the CORDA team; all three score below the sample median on D3 (Elite Defection and Intra-Elite Conflict), with the United States (75.5) and Poland (79.1) nonetheless retaining comparatively high D4 scores relative to their overall rank.
- Singapore presents the most internally inconsistent driver profile in the sample. Its D2 (Information Environment Shocks) score of 46.6 is noticeably lower than its D1 (66.7), D3 (63.7), and D4 (68.1) scores, illustrating how a single weak driver can substantially depress an otherwise strong overall position (60.1, ranked 17th).
- Among the six countries classified as Hybrid or Authoritarian regimes, namely Singapore, Mexico, Nigeria, Bangladesh, the United Arab Emirates, and China, D5 (Polarisation) follows a noticeably different pattern from that observed among the top-ranked Liberal Democracies. For four of the six (Nigeria, Bangladesh, the United Arab Emirates, and China), the D5 score is higher than the average of that country's other four driver scores. These findings are consistent with our framework's treatment of affective tribalism as conceptually distinct from, instead of a proxy for, authoritarian control.
- Across all sensitivity tests, such as variation in imputation, normalisation, and weighting specifications, the overall ranking is highly robust, with Kendall's τ values between 0.9487 and 1.0000 for every test except geometric aggregation, indicating that our core findings are not artefacts of any single methodological choice.

Methodology

Our index is constructed through an eight-step procedure, summarised below; full technical details, including formulae, data tables, and sensitivity results, are available in the Methodology and Implementation section of the dashboard.

The first step establishes the theoretical framework underpinning the index. We structure the CORDA Index around five theoretical drivers of democratic change—economic inequality and relative deprivation (D1), information environment shocks (D2), elite defection and intra-elite conflict (D3), state capacity erosion (D4), and polarisation and affective tribalism (D5)—each grounded in the comparative democratisation literature and each possessing a theoretically coherent pathway through which AI can plausibly amplify the underlying condition. The index also incorporates non-AI-specific democratic health indicators alongside AI-specific ones, since testing an amplification claim requires measuring the driver and the amplifier independently.

The second step concerns data selection. Two researchers from our team worked independently to identify candidate indicators, where one was responsible for covering AI-specific measures and the other for identifying democratic health measures. We drew on established sources including V-Dem, the EIU Democracy Index, Freedom House, the WJP Rule of Law Index, and the Stanford AI Index, among others. Indicators were assessed for relevance to our theoretical framework and for the validity and methodological rigour of their underlying source.

The third step addresses missing data. We conducted a missingness audit and classified each indicator as either Missing Not at Random (MNAR) or Missing at Random (MAR). MNAR indicators were left unimputed, to avoid introducing bias; the single MAR indicator, World Bank GovTech, was imputed using linear interpolation. We then applied a threshold of no more than 30% missingness per indicator, retaining 93 of 118 candidate indicators. A total of 10 of the 27 countries in our sample have missing values among the final indicator set, and partial weighting (described in the sixth step) was used to address this.

The fourth step is a multivariate analysis of the retained indicators. We used Cronbach's alpha (α) to assess the internal consistency of indicators within each driver, applying a threshold of 0.7. D1 through D4 showed high internal consistency (α between 0.920 and 0.957), while D5 showed noticeably lower consistency ($\alpha = 0.088$ cross-sectional), which we interpret as evidence that the underlying construct is multidimensional but not a measurement error. We also examined pairwise correlations within each driver and removed indicators identified as redundant ($r > 0.9$) where a broader composite measure was available.

The fifth step is normalisation. Because our indicators are reported on different scales, we applied min-max normalisation to rescale all values to a common 0–100 range, using the global minimum and maximum across all countries and years to preserve comparability over time. Before normalising, we reversed the direction of indicators associated with democratic risk, so that higher values always indicate better democratic health throughout the index.

The sixth step is weighting and aggregation. Each of the five drivers contributes equally to the overall CORDA Index Score, at 20% each. Within each driver, indicators are weighted equally, at a weight of $1/n$, where n is the number of available indicators for that driver and country. Where data is missing for a given indicator, its weight is redistributed proportionally among the remaining available indicators for that driver and country, so that countries with missing data are not penalised outright (note: though this approach carries its own limitations, discussed in full in the dashboard).

The seventh step is an uncertainty and sensitivity analysis. We tested the robustness of the index ranking against variation in imputation method, normalisation method, driver weighting, and aggregation method, using Kendall's τ to compare each alternative ranking against our primary specification. The ranking proved highly robust to changes in imputation, normalisation, and weighting (τ between 0.9487 and 1.0000), with the exception of aggregation method. We found that substituting geometric for linear aggregation shifted New Zealand's rank from 10th to 19th, owing to the country's comparatively weak D5 score relative to its other four drivers.

The eighth and final step is the visualisation of results. The dashboard presents the index through three complementary views. First, the ranking view shows each country's composite and driver-level scores as stacked bars. Second, the scatter plot enables comparison between any two drivers, or between a driver and the overall score. Third, the world map displays colour intensity that corresponds to a country's score on the selected measure. Users may filter by regime type, region, and other dimensions to explore our results most relevant to their own interests.

Table 1 — Global Rankings and Scores: Overview

Index Score = equally weighted mean of five driver scores (D1–D5). All scores normalised 0–100 (higher = more AI-ready / more democratic). Most recent available data per indicator; primarily 2023–2025. Exceptions: RSF Press Freedom and all WJP Rule of Law indicators use 2021 data (last available edition in dataset).

RANK	COUNTRY	CORDA INDEX SCORE	D1 — Economic Inequality / Relative Deprivation	D2 — Information Environment Shocks	D3 — Elite Defection / Intra-Elite Conflict	D4 — State Capacity Erosion	D5 — Polarisation / Affective Tribalism

D1 Indicators — Economic Inequality / Relative Deprivation

[Abbreviated name in table] = [Full indicator name]: [Operationalisation] (Data source)

AI Replace Job (Ipsos) = % Agreeing With Statement: AI Will Replace My Current Job In The Next 5 Years: Share of adults agreeing AI will replace their current job within 5 years; reversed so higher = less displacement fear (Ipsos AI Monitor)

FH: Equal Treatment = F4: Equal treatment of population segments: Freedom House score for equal legal treatment of all population segments including minorities (Freedom House Freedom in the World)

Human Capital (IMF AIPI) = Human Capital and Labour Market Policies: IMF sub-dimension measuring education quality, labour-market adaptability, and AI reskilling policy capacity (IMF AI Preparedness Index)

Social Group Equality = IDEA GSoD: Social Group Equality: Degree to which all social groups enjoy equal political, civil, and socioeconomic rights and freedoms (IDEA Global State of Democracy)

GIRAI: Labour Prot. = TA11: Labour Protection and Right to Work: GIRAI thematic area score for legislative and regulatory frameworks protecting workers in an AI-driven economy (Global Index on Responsible AI (GIRAI))

Power by Socioec. Pos. = v2pepwrse: Power Distributed by Socioeconomic Position: Degree to which political power is distributed by socioeconomic position rather than universal suffrage (V-Dem)

Egalitarian Index = v2x_egal: Egalitarian Component Index: V-Dem composite measuring equal distribution of resources, access, and protection across social groups (V-Dem)

Equal Access Index = v2xeg_eqaccess: Equal Access Index: Degree to which all social groups have equal access to political and civil power (V-Dem)

Equal Dist. Resources = v2xeg_eqdr: Equal Distribution of Resources Index: Degree to which material and political resources are equally distributed across social groups (V-Dem)

Table 3 — D2: Information Environment Shocks

21 composite-eligible indicators. AI indicators: AI Trust (Ipsos), Algorithmic Transparency (CAIDP), Party Disinformation (V-Dem DSP / v2smpardom). Non-AI: V-Dem media freedom variables, FH, EIU Civil Liberties, IDEA Freedom of Expression/Press, RSF Press Freedom. Note: RSF Press Freedom data is from 2021 (last available edition in dataset).

D2 Indicators — Information Environment Shocks

[Abbreviated name in table] = [Full indicator name]: [Operationalisation] (Data source)

- AI Trust (Ipsos)** = % Agreeing With Statement: I Trust AI To Not Discriminate Or Show Bias Towards Any Group Of People: Share of adults trusting AI systems not to discriminate or show bias against any group (Ipsos AI Monitor / Stanford AI Index)
- Algorithm. Transparency** = CAIDP AI & Democratic Values Index: Q9 Algorithmic Transparency Law: Ordinal score for existence of national legal right to algorithmic transparency (0=None, 1=Partial, 2=Full law) (CAIDP AI & Democratic Values Index)
- FH: Free Media** = D1: Free and independent media: Freedom House score for independence of print, broadcast, and online media from government and commercial interference (Freedom House Freedom in the World)
- FH: Free Discussion** = D4: Free private discussion: Freedom House score for freedom of private conversation, including online and offline discussion (Freedom House Freedom in the World)
- EIU: Civil Liberties** = EIU: Civil Liberties Index: EIU composite score covering freedom of expression, association, and personal autonomy (EIU Democracy Index)
- Freedom of Expression** = IDEA GSoD: Freedom of Expression: Degree to which political and civic freedoms of expression are protected in law and practice (IDEA Global State of Democracy)
- Press Freedom** = IDEA GSoD: Freedom of the Press: Degree to which media operate freely from government censorship or interference (IDEA Global State of Democracy)
- RSF Press Freedom** = RSF: Press Freedom Score (0-100, lower=more free): RSF composite score for press freedom conditions; reversed so higher = freer press environment (Reporters Without Borders (RSF))
- Gov. Media Bias** = v2mebias: Government Media Bias: Extent to which government and ruling party media dominate the national information environment (V-Dem)
- Internet Censorship** = v2mecenefi: Internet Censorship Effort: Extent to which the government attempts to censor or block online content (V-Dem)
- Gov. Media Censorship** = v2mecenefm: Government Censorship Effort — Media: Extent to which the government censors traditional print and broadcast media (V-Dem)
- Journalist Harassment** = v2meharjrn: Harassment of Journalists: Frequency of physical, legal, or administrative harassment of journalists by government or other actors (V-Dem)
- Media Perspectives** = v2merange: Range of Media Perspectives: Breadth of political and social perspectives represented across the national media landscape (V-Dem)
- Media Self- Censorship** = v2meslfcen: Media Self-Censorship: Frequency with which journalists and editors self-censor for political reasons (V-Dem)
- Foreign Gov. Disinfo** = v2smfordom: Foreign Government Dissemination of False Information: Extent to which foreign governments disseminate false information within the domestic information environment (V-Dem Digital Society Project (DSP))
- Gov. Disinfo Abroad** = v2smgovab: Government Dissemination of False Information Abroad: Extent to which the domestic government disseminates false information in foreign countries (V-Dem Digital Society Project (DSP))
- Gov. Disinfo Domestic** = v2smgovdom: Government Dissemination of False Information Domestic: Extent to which the domestic government disseminates false information to its own population (V-Dem Digital Society Project (DSP))
- Party Disinfo (DSP)** = v2smpardom: Party Dissemination of False Information Domestic: Extent to which political parties disseminate false information within the domestic information environment (V-Dem Digital Society Project (DSP))
- Online Content Regulation** = v2smregapp: Government Online Content Regulation Approach: Degree to which government regulation of online content is permissive versus restrictive (V-Dem Digital Society Project (DSP))
- Internet Legal Regulation** = v2smregcon: Internet Legal Regulation Content: Extent of legal restrictions on internet content and online political expression (V-Dem Digital Society Project (DSP))
- Free Exp. Alt. Info** = v2x_freexp_altinf: Freedom of Expression and Alternative Information Index: V-Dem composite capturing freedom of expression and access to alternative information sources (V-Dem)

Table 4 — D3: Elite Defection / Intra-Elite Conflict

21 composite-eligible indicators. AI indicators: GIRAI Competition Authorities (TA4), Public Participation (TA14), Tortoise AI Companies/Funding. Non-AI: V-Dem election/party variables, FH B1–B3, EIU Electoral Pluralism, IDEA election indices.

D3 Indicators — Elite Defection / Intra-Elite Conflict

[Abbreviated name in table] = [Full indicator name]: [Operationalisation] (Data source)

- FH: Party Organise** = B1: Right to organise political parties: Citizens’ right to form and join political parties without undue government restriction (Freedom House Freedom in the World)
- FH: Opposition Opportunity** = B2: Realistic opposition opportunity: Degree to which opposition parties can realistically compete for and exercise political power (Freedom House Freedom in the World)
- FH: Political Choices** = B3: Political choices free from external/extrapolitical domination: Freedom from military, foreign, or other undemocratic interference in citizens’ political choices (Freedom House Freedom in the World)
- AI Companies (Tortoise)** = Commercial Ecosystem: Companies score: Tortoise relative index of national AI company density and scale; reversed so higher = less commercial AI concentration risk (Tortoise Global AI Index)
- AI Funding (Tortoise)** = Commercial Ecosystem: Funding score: Tortoise relative index of AI startup and company funding as share of GDP; reversed so higher = less capital concentration risk (Tortoise Global AI Index)
- EIU: Electoral Pluralism** = EIU: Electoral Pluralism Index: EIU composite score for electoral process fairness, competitive elections, and political pluralism (EIU Democracy Index)
- Credible Elections** = IDEA GSoD: Credible Elections: Degree to which elections are free, fair, and credible as measured by voter registration, campaign freedom, and administration quality (IDEA Global State of Democracy)
- Elected Govt** = IDEA GSoD: Elected Government: Degree to which the government is elected through free and fair elections and remains accountable to the electorate (IDEA Global State of Democracy)
- Free Political Parties** = IDEA GSoD: Free Political Parties: Degree to which political parties can form and operate freely within the electoral arena (IDEA Global State of Democracy)
- GIRAI: Public Participation** = TA14: Public Participation and Awareness: GIRAI thematic area score for legal frameworks and initiatives enabling public participation in AI governance (Global Index on Responsible AI (GIRAI))
- GIRAI: Competition** = TA4: Competition Authorities: GIRAI thematic area score for the existence and capacity of competition authorities to address AI-related market concentration (Global Index on Responsible AI (GIRAI))
- Election Boycotts** = v2elboycot: Election Boycotts: Frequency with which significant political parties or groups boycott elections (V-Dem)
- Free & Fair Elections** = v2elfrfair: Free and Fair Elections Index: V-Dem composite measuring the overall freedom and fairness of the electoral process (V-Dem)
- Election Intimidation** = v2elintim: Election Government Intimidation: Degree to which government intimidates voters, candidates, or opposition during elections (V-Dem)
- Election Irregularities** = v2elirreg: Election Irregularities: Frequency of vote fraud, ballot stuffing, and other electoral irregularities (V-Dem)
- Party Cohesion** = v2pscohesv: Legislative Party Cohesion: Degree to which political parties vote cohesively as a bloc in the legislature (V-Dem)
- Opposition Autonomy** = v2psoppaut: Opposition Parties Autonomy: Degree of autonomy of opposition parties from government pressure and cooptation (V-Dem). **Note:** United Arab Emirates value uses 2019 data — V-Dem does not score United Arab Emirates on this indicator after 2019 due to absence of multiparty elections.
- Party Platforms** = v2psplats: Party Platforms: Degree to which parties present programmatic policy platforms to voters rather than personality-based campaigns (V-Dem)
- Party Branches** = v2psprbrch: Party Branches: Extent to which political parties maintain local branches and grassroots organisational presence (V-Dem)
- Party-Pop. Linkages** = v2psprlnks: Party-Population Linkages: How parties link to the population through programmatic, clientelistic, or other organisational means (V-Dem)
- Electoral Regime** = v2x_elecreg: Electoral Regime Index: V-Dem composite capturing the overall integrity and competitiveness of the national electoral regime (V-Dem)

Table 5 — D4: State Capacity Erosion

22 composite-eligible indicators. AI indicators: Gov. AI Strategy/Spend (Tortoise), GIRAI AI Policy/Transparency, WB GovTech, Stanford AI Bills. Non-AI: FH C1–C3, TI CPI, WJP Rule of Law, CIVICUS, EIU, V-Dem governance variables. Note: WJP Rule of Law Overall Score, WJP Factor 1, and WJP Factor 3 use 2021 data (last available edition in dataset).

D4 Indicators — State Capacity Erosion

[Abbreviated name in table] = [Full indicator name]: [Operationalisation] (Data source)

- FH: Elected Rep. Policy** = C1: Elected representatives determine policy: Degree to which elected officials actually determine and implement government policy free from veto players (Freedom House Freedom in the World)
- FH: Anti- corruption** = C2: Anticorruption safeguards: Strength of legal and institutional safeguards against public sector corruption (Freedom House Freedom in the World)
- FH: Gov. Openness** = C3: Government openness and transparency: Degree of transparency in government operations and accountability of public officials (Freedom House Freedom in the World)
- CIVICUS Civic Space** = CIVICUS: Civic Space Score: CIVICUS composite score for civil society operating conditions including freedoms of association, assembly, and expression (CIVICUS Monitor)
- Corruption Perceptions** = CPI Score: Corruption Perceptions Index: Transparency International composite of perceived public sector corruption based on expert and business surveys (Transparency International)
- EIU: Funct. Govt** = EIU: Functioning Government Index: EIU composite measuring government effectiveness, accountability, and freedom from corruption (EIU Democracy Index)
- Gov. AI Spend** = Government Strategy: Government spend score: Tortoise relative index of government financial commitments to AI infrastructure and public AI programmes (Tortoise Global AI Index)
- Gov. AI Strategy** = Government Strategy: Strategy score: Tortoise relative index measuring comprehensiveness and implementation quality of national AI strategy (Tortoise Global AI Index)
- GIRAI: Natl AI Policy** = National AI Policy dimension score: GIRAI dimension score for comprehensiveness and implementation status of national AI policy frameworks (Global Index on Responsible AI (GIRAI))
- AI Bills (Stanford)** = Number Of AI-Related Bills Passed Into Law: Count of AI-related legislative bills enacted into law as of the reference year (Stanford AI Index)
- GIRAI: Transparency** = Transparency and Explainability dimension score: GIRAI dimension score for national requirements on AI transparency and explainability in public and private systems (Global Index on Responsible AI (GIRAI))
- GovTech Index (WB)** = WB GovTech: Government Technology Enablers Index (GTEI): World Bank composite measuring enabling conditions for government digital transformation and e-governance capacity (World Bank GovTech Maturity Index)
- WJP: Govt Constraints** = WJP: Factor 1 - Constraints on Government Powers: Degree to which government powers are constrained by constitutional and institutional checks and balances (WJP Rule of Law Index)
- WJP: Open Govt** = WJP: Factor 3 - Open Government: Government transparency, civic participation in law-making, and accessible complaint mechanisms (WJP Rule of Law Index)
- WJP: Rule of Law** = WJP: Rule of Law Index Overall Score: WJP composite score across all rule of law dimensions including constraints, absence of corruption, and order (WJP Rule of Law Index)
- Legislative Constraints** = legis_constr_vdem: Legislative Constraints on Executive: V-Dem composite measuring the legislature’s capacity to constrain and oversee executive power (V-Dem)
- Public Sector Corruption** = v2excrpts: Public Sector Corrupt Exchanges: Frequency of corrupt exchanges in public sector administration; reversed so higher = less corruption (V-Dem)
- State Admin. Appointments** = v2stcritrecadm: Criteria for State Administration Appointments: Degree to which public administration appointments are merit-based rather than politically motivated (V-Dem)
- Bureaucratic Remuneration** = v2strenadm: Bureaucratic Remuneration: Adequacy of bureaucratic pay and professionalism as a basis for capable public administration (V-Dem)
- Territory Control** = v2svstterr: Percentage of Territory Under State Control: Share of national territory over which the state exercises effective administrative and security control (V-Dem)
- Political Corruption** = v2x_corr: Political Corruption Index: V-Dem composite of political corruption across executive, legislative, and judicial branches; reversed so higher = less corrupt (V-Dem)
- Neopatri- monial Rule** = v2x_neopat: Neopatrimonial Rule Index: Degree of personalised patrimonialist governance; reversed so higher = less neopatrimonial and more institutionalised (V-Dem)

Table 6 — D5: Polarisation / Affective Tribalism

9 composite-eligible indicators (all non-AI). EIU Democratic Culture, IDEA Civil Society, V-Dem polarisation, political violence, mobilisation, and social media variables. Note: D5 Cronbach α = 0.31 — indicators measure distinct sub-constructs; equal weighting applied.

RANK	COUNTRY	CORDA SCORE	DRIVER SCORE	D5 — Polarisation / Affective Tribalism								
				EIU: Dem. Culture	Civil Society (IDEA)	Autocracy Mobilisation	Political Polarisation	Democracy Mobilisation	Political Violence	Social Media Freedom	Online Hate Speech	Societal Polarisation
1	Denmark	86.2	70.5	92.4	88.9	94.3	75.9	34.2	2.8	83.4	73.5	89.3

D5 Indicators — Polarisation / Affective Tribalism

[Abbreviated name in table] = [Full indicator name]: [Operationalisation] (Data source)

EIU: Dem. Culture = EIU: Democratic Culture Index: EIU composite measuring public support for democratic norms, civic values, and willingness to defend democracy (EIU Democracy Index)

Civil Society (IDEA) = IDEA GSoD: Civil Society: Degree to which civil society organisations can form and operate freely and effectively without government interference (IDEA Global State of Democracy)

Autocracy Mobilisation = v2caautmob: Mobilisation for Autocracy: Degree to which political actors mobilise popular support for autocratic governance; reversed so higher = less mobilisation (V-Dem)

Political Polarisation = v2cacamps: Political Polarisation (interval scale): V-Dem interval-scale estimate of elite and mass political polarisation; reversed so higher = less polarised (V-Dem)

Democracy Mobilisation = v2cademmob: Mobilisation for Democracy: Degree to which political actors mobilise popular support for democratic norms and institutions (V-Dem)

Political Violence = v2caviol: Political Violence: Frequency of politically motivated violence by government or non-state actors; reversed so higher = less violence (V-Dem)

Social Media Freedom = v2smmefra: Social Media Freedom and Fractionalisation: Degree of freedom and openness in the social media environment, including absence of censorship and manipulation (V-Dem Digital Society Project (DSP))

Online Hate Speech = v2smpolhate: Political Parties Hate Speech Online: Frequency of hate speech by political parties on social media; reversed so higher = less hate speech (V-Dem Digital Society Project (DSP))

Societal Polarisation = v2smpolsoc: Polarisation of Society: Degree of overall societal polarisation along political, ethnic, or religious lines; reversed so higher = less polarised (V-Dem Digital Society Project (DSP))
